

Solar roof tiles from autarq. Cooperation with Creaton to quadruple sales.

autarq is investing over 1 million euros in 2018 to significantly increase the production volume of solar roof tiles. The goal is to produce at least 500,000 solar roof tiles per year once the automated production line has been set up.

The cooperation with Creaton AG in Wertingen has also contributed to this development. “Our Domino smooth tile has already proven to be a very suitable model for producing solar roof tiles during the last two years, and we’re looking forward to the increased cooperation with autarq,” says Ann-Katrin Rieser, Head of Target Group Marketing at Creaton. In fact, autarq has already been producing solar roof tiles based on the Creaton smooth tile since 2016.

“For autarq, this recognition by Creaton AG, one of Europe’s leading roofing brands, reinforces confidence in the quality of our products – the basis for our cooperation,” confirms company spokesperson Martin Flossmann. Supplying energy from your own roof instead of buying electricity is increasingly topping the wish list of house builders. It’s hard to miss the large-scale photovoltaic modules you see perched on top of many roofs. But they can also be almost invisible: As an alternative, autarq solar roof tiles offer a smart roof that particularly emphasises the value of the house. And the non-hazardous low voltage (< 120 V) even enables the solar power system to be installed in a single step when the roof is covered by the roofer – the ideal product for renovation and new-build schemes. No changes are necessary to the roof itself: The weight is approximately the same as the original tile, the roof’s structural load-bearing capacity is not impaired, and the cables and plug contacts lie under the roof cladding and are therefore protected against the weather. 40 square metres of roof space are often sufficient to generate enough electricity for self-consumption in the house. And: autarq offers individual and complete system solutions.
